

Notes

Notes centralizes and organizes internal communication for financial advisors and home office teams. Notes can be created and managed for accounts, clients, and leads, and they automatically roll up to the household level, providing a unified view of all related records.

Key Features

- Attach documents (PDF, DOC, JPG, etc.) up to 20MB for added context
- Add tags and categories to make notes easily searchable
- Edit notes with a built-in rich-text editor

How to create Notes

To create a note, open the relevant notes widget from within the entity's page, or the consolidated notes view in the portal (Lead, Client, Account, or FP detailed board).

Enter the required details, including a title, the note description, and any applicable categories or tags if supported. Attachments can be added for context, and privacy settings applied if supported. Once saved, the note will automatically display in the list, with options to edit, delete, and search.

Important: Notes cannot be created directly at the Household (HH) level. The HH Notes widget displays an aggregated view of notes created on linked accounts, clients, and leads. For this reason, the HH-level Notes widget does not include a **Create** button.

Notes from Meeting

Notes from Meeting is an automated documentation feature that captures and organizes the results of client meetings by integrating directly with **Microsoft Teams**. It eliminates the need for manual note-taking and ensures that every meeting is recorded in a consistent, structured, and searchable format.

This feature helps maintain continuity across teams, reduces the chance of missing important details, and creates a reliable history of all interactions. Every generated note includes the essential elements needed for follow-up and compliance tracking, such as:

- **A clear meeting summary** that outlines the purpose and outcome
- **Discussion points** that highlight what topics were covered
- **Action items** that indicate next steps and responsibilities

Each note is automatically linked to the related client record, keeping all meeting intelligence stored in one place.

How it works

Meeting notes are activated once consent is provided for Microsoft Teams integration.

- The system connects to Teams and detects meetings associated with the email address stored in the client record.
- After the meeting concludes, Microsoft Teams generates a **full transcript** of the conversation.
- The system retrieves the transcript and processes it using AI to identify key elements such as:
 - **Main topics discussed**
 - **Decisions made**
 - **Recommendations provided**
 - **Follow-up tasks or commitments**
- A structured note is created automatically and attached to the client's record.

All notes remain available for review, ensuring a complete meeting history and improved collaboration across the team.

Tasks from Notes

Tasks from Notes transforms meeting follow-ups into **actionable tasks** without requiring manual task entry.

This feature streamlines workflow management by allowing every action item identified in a meeting note to be turned into a task with clear ownership, deadlines, and priority.

It helps ensure that commitments made during meetings are **captured, tracked, and completed**, reducing the risk of missed deadlines or forgotten follow-ups. Tasks created from notes become part of the main task list, improving visibility and accountability across the team.

How it works

A meeting note that contains **AI-identified action items** serves as the starting point:

- Action items can be selected individually, allowing only **relevant follow-ups** to be converted into tasks.
- For each selected item, the following details can be configured:
 - **Due date** to define when the task should be completed
 - **Priority level** (e.g., high, medium, low) to set urgency
 - **Assigned team member** to establish responsibility
- After the task is created, it appears immediately in the task list with all chosen parameters.
- Tasks can be managed, updated, and tracked alongside tasks created elsewhere in the system.
- Future enhancements will expand this functionality, including:
 - **Automated alerts and notifications**
 - **Integration with additional workflow or CRM tools**
 - **Support for converting tasks into full workflows or process steps**

AI Summarize Document

AI Summarize Document is a powerful tool that analyzes uploaded documents and generates a clean, concise summary of their key points. It is especially useful when dealing with long reports, client-provided documents, agreements, or any text-heavy file that requires a quick understanding.

By automatically distilling essential information, the feature ensures that important insights are not overlooked and that documentation remains organized and easy to reference. The generated summary and the original file are stored together in a new note, preserving both the source material and the interpreted insights.

How it works

The process begins by selecting **Generate from File** when creating a new note.

- A file is uploaded, supported formats include **Word documents** and **plain text files**.
- AI analyzes the full content of the document, identifies the most relevant points, and produces a structured summary that highlights:
 - **Key themes**
 - **Important facts or statements**
 - **Critical conclusions or recommendations**
- A new note is created automatically and contains:
 - **The AI-generated summary** for quick reference
 - **The original uploaded file** is an attachment for the full context

This ensures that document insights are captured consistently and can be reviewed at any time without re-reading lengthy files.
